

Carefully read the following instructions before use.

#### Description of the device

The Rocamed urethral stent is a sterile single use device comprising two tubular sections in silicone linked by a connecting thread. The stent enables drainage outside of the bladder. The two parts of the stent present wings to ensure its stability on each side of the strated sphincter and to avoid migration of the stent. The stent is supplied mounted on its insertion device.

The Rocamed urethral stent is for single use (30 days maximum).

EXIME®-M : bladder neck-prostatic apex distance < 5 cm

EXIME®-L : bladder neck-prostatic apex distance: 5-7 cm

1. Prostatic part
2. Bulbar part of the stent
3. Connecting thread between the two parts
4. Stabilizing wings
5. Safety removal thread
6. Pusher tube
7. Flattener tube of the wings
8. Flattener tube pink bumper
9. Luer connection between pusher tube and stylet of alignment.

#### Indications

The Rocamed urethral stent is for drainage of the urine from the bladder via the urethral canal in the adult male in acute or chronic urine retention.

#### Contraindications

Infection of the genito-urinary system, macrohematuria, haematuria with clots, sphincter insufficiency.

Urinary tract diseases, such as urethral stenosis, urethral false route, bladder stones or other significant diseases that may affect the normal functioning of the device.

Do not use after treatment with a physical agent generating prostatic edema and possibly macroscopic haematuria (such as, hydrocephalic radiotherapy, brachytherapy, focused ultrasound, trans-urethral micro-wave thermotherapy...), until the urine becomes clear (48h minimum).

Do not use, when, on the advice of the doctor, such a procedure would be contrary to the greater interest of the patient.

#### Possible complications

Urinary urgency, weak urinary stream, acute urinary retention, urinary leaks, urethral inflammation, bladder lithiasis, haematuria, acute prostatitis, orchiepididymitis, perineal pain, urinary infection, fever, retrograde ejaculation, and other typical complications linked to the placement of urethral stents.

#### Adverse events

The adverse events associated with the use of this device include, without being limited to: migration, expulsion, encrustation of the device, breakage of the connection thread between the two tubes of the device, breakage of the removal thread, false urethral route at the time of placement of the device.

#### Precautions

The following instructions for use must be scrupulously followed in order to ensure correct placement and correct functioning of the device and the safety of the patient:

1. Placement and removal of this device are reserved for practitioners specialised in surgical urology.

2. Do not use the device if the packaging is damaged, compromising the integrity of the latter and/or its sterility.

3. Do not use the device if it has exceeded the expiry date.

4. Check the integrity of the device before use. Do not use in case of suspicion about its integrity.

5. After removal of the stent, the safety removal thread of the stent should be put in place by the practitioner to evaluate the performances of the device and check if there are any complications. During this monitoring, any suspicion of abnormality or of incorrect functioning of the device should lead to its removal and implementation of the appropriate treatment.

6. Proceed with caution during insertion and removal of the device. During insertion, stop immediately in the event of excessive resistance to progression of the device in the urethra.

7. An antibiotic prophylaxis is recommended before placement.

8. Use of this device is not recommended on magnetic resonance imaging (MRI) device has not been evaluated.

9. Do not use on a patient presenting with allergy or sensitivity to silicone.

10. Do not try to insert a urinary catheter (indwelling Foley catheter) in a patient fitted with this device. In case of acute urine retention, remove the device before insertion of an indwelling Foley catheter.

#### Instructions for use

The following instructions for use must be scrupulously followed in order to ensure correct functioning of the device and the safety of the patient.

1. Before use, check the integrity of the device and the correct position of all the elements. Ensure that:

1. The translucent flattener tube covers the wings of the prostatic and bulbar parts of the stent. The pink bumper thread is correctly blocked in the Luer connection: a slight traction on this thread must show the absence of any mobilization of the thread.

2. Instill a syringe of lubricating gel and local anaesthetic in the urethral meatus. Stretch the penis vertically and insert the 22/24FR tube through the urethral meatus so as to verify the absence of urethral stenosis. Insert the tube in the bulbous part of the bougie against the inner wall of the bulbous urethra. Read and note the depth of insertion on the graduated scale of the pusher tube.

3. After removal of the bougie, keep the penis vertically stretched and insert the device. When the pink bumper of the flattener tube is blocked against the urethral meatus, continue to glide the pusher tube inside the flattener tube while maintaining vertical fraction of the penis.

4. Glide the device inside the urethra at the same depth as the one measured previously with the bougie. At this time, the operator feels the abutment of the device against the posterior wall of the bulbous urethra. When the operator feels progression is stopped, the stent is in the correct position. The stylet, the flattener tube and the removal thread can be removed.

5. Still keeping the penis stretched vertically with the same hand, take hold of the pusher tube in the other hand and unscrew the Luer connector between thumb and index so as to release the removal thread. Retrieve the stylet and the pusher tube vertically.

6. Pull lightly on the removal thread which exceeds the urethral meatus. The perception of an elastic resistance enables to check that the prosthetic tube is correctly in place. Its wings about the strated sphincter of the urethra.

If this is not the case, remove the device.

7. Cut the removal thread with a pair of sterile scissors leaving it to come out around 10 mm outside of the meatus.

8. Ask the patient to get up and urinate. The correct position and the correct functioning of the device are confirmed by the absence of fuites in descendant de la table d'examen ou du lit et par l'émission d'urine claire.

9. The patient can be left to urinate. The correct position and the correct functioning of the device are confirmed by the absence of fuites in descendant de la table d'examen ou du lit et par l'émission d'urine claire.

10. Clean the penis and the perineum with antiseptic solution.

11. Remove the device and the removal thread.

12. Clean the penis and the perineum with antiseptic solution.
